Description			
It seems that there's no avahi package in home brew. I didn't see a good way to install avahi from source, as it appears that their website is currently down. Instead, I switched to macports. But it might be good to provide suggestions in the documentation on installing avahi for home brew users.

#2 - 07/12/2016 01:45 PM - Eric Allman

- Status changed from New to Feedback

I updated the documentation to make this clear and added a compile flag to make it easier to compile Zeroconf out. It's not fully automatic but it's less painful.

#3 - 07/28/2016 08:50 AM - Eric Allman

- Status changed from Feedback to Closed

No feedback for two weeks, so I'm presuming this fix is deemed adequate. Marking as closed.
